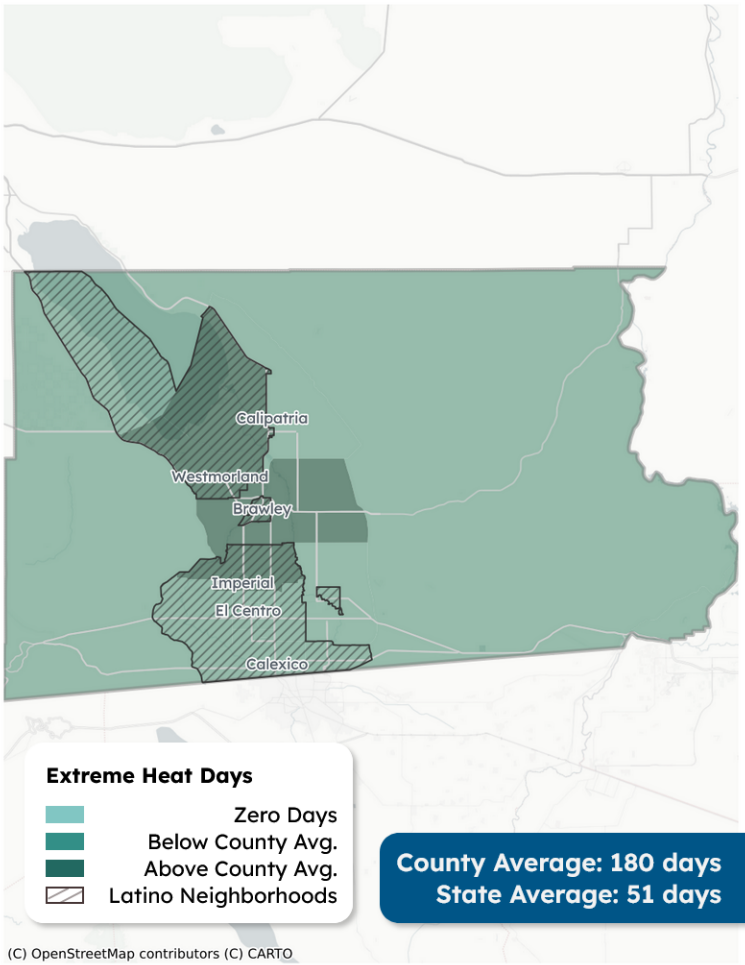
Neighborhood Statistics

Extreme Heat Days

Latino neighborhoods = Census tracts with 70%+ Latino residents
Non-Latino neighborhoods = Census tracts with 70%+ non-Latino residents

Extreme heat days are defined as days where the temperature is at or above 90°F. Exposure to extreme heat poses significant health risks.

Latino Neighborhoods and Exposure to Extreme Heat Days (≥ 90°F), 2018-2022



Annual Number of Extreme Heat Days (2018-2022)

At 90°F, the risk of heat-related illnesses and conditions increases significantly.

Latino neighborhoods	NL neighborhoods
180 days	175 days

average days ≥ 90°F annually

Longest Period of Consecutive Extreme Heat Days (2022)

The Federal Emergency Management Agency defines a period of extreme heat in most of the U.S. as a period of 2 to 3 days above 90°F.

Latino neighborhoods	NL neighborhoods
125 days	130 days

consecutive days ≥ 90°F annually

Projected Number of Extreme Heat Days by Mid-Century (2035–2064)

Looking forward, Non-Latino neighborhoods are projected to experience a greater number of extreme heat days.

Latino neighborhoods	NL neighborhoods
208 days	219 days

expected days ≥ 90°F annually

Neighborhood Statistics (cont.)

Barriers and Facilitators To Preventing Heat Exposure

Tree Canopy

Tree canopy is land shaded by trees.
Less tree canopy (fewer trees) = Increased exposure to extreme heat

% of Land with Tree Canopy

2%	1%
Latino neighborhoods	**NL** neighborhoods

Impervious Surfaces

Impervious surfaces are water-resistant surfaces such as concrete, asphalt, and stone.
More impervious surfaces (like paved roads) = Increased exposure to extreme heat

% of Land with Impervious Surfaces

30%	1%
Latino neighborhoods	**NL** neighborhoods

Older Housing Units

Older housing units are homes built before 1970 that often have poor insulation and inefficient HVAC systems.
More older homes = Increased exposure to extreme heat

% of Older Housing Units

23%	26%
Latino neighborhoods	**NL** neighborhoods

Vulnerable Groups

Age

Children and older adults are at higher risk for heat-related illnesses.

30% ages 0-18	14% ages 65+	13% ages 0-18	9% ages 65+
Latino neighborhoods		**NL neighborhoods**	

Workers in Heat-Exposed Industries

Industries with the highest exposure to extreme heat include agriculture, construction, waste management, and warehousing. Jobs in these sectors carry increased risks of heat-related illnesses such as heat stroke, dehydration, chronic heat stress, and even premature death.

% of Workers in Heat-Exposed Industries

24%	29%
Latino neighborhoods	**NL neighborhoods**

Health

Extreme heat poses serious health risks, especially for people with conditions like heart disease, asthma, diabetes, and obesity. These individuals are more vulnerable because heat places extra stress on the body, worsening symptoms and increasing the risk of medical emergencies.

% of Adults (18+) with Pre-Existing Conditions

14% Latino neighborhoods	14% NL neighborhoods	37% Latino neighborhoods	40% NL neighborhoods
Diabetes		**Obesity**	

Emergency Department Visits (per 10,000 people)

20 Latino neighborhoods	13 NL neighborhoods	91 Latino neighborhoods	47 NL neighborhoods
Heart Attacks		**Asthma Attacks**	

Heat-Related Emergency Department Visits

Heat-related emergency room visits serve as a critical indicator of a neighborhood's vulnerability to extreme temperatures and the effectiveness of its heat mitigation strategies.

per 10,000 people

2 Latino neighborhoods

2 NL neighborhoods

Disadvantaged Communities

The CA Environmental Protection Agency defines disadvantaged communities based on their environmental pollution burden and population characteristics. Under Senate Bill 535, revenue from CA's Cap-and-Trade Program is partly directed toward these communities through the CA Climate Investments program to reduce pollution, enhance climate resilience, and improve health and economic well-being.
