# **Barriers and Facilitators To Preventing Heat Exposure**

### **Tree Canopy**

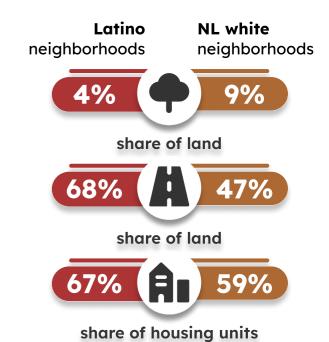

Trees provide natural protection from extreme heat, reducing temperatures in areas with higher canopy coverage. Less tree cover can increase heat exposure.

#### **Impervious Surfaces**

Impervious surfaces, such as roads and buildings, increase heat retention and contribute to higher temperatures.

### Older Housing Units (built pre-1970)

Older homes' structural characteristics, such as a lack of insulation, single-pane windows, inefficient HVAC systems, and outdated construction materials, can make them more susceptible to extreme temperatures.

## **Vulnerable Groups**

### Age

Older adults and children are at higher risk for heat-related illnesses.

11% 25% ages 0-18 ages 60+ Latino neighborhoods

18% 21% ages 0-18 ages 60+ **NL** white neighborhoods

### **Workers in Heat-Exposed Occupations**

Not all occupations carry the same risk for heat-related fatalities. According to the Bureau of Labor Statistics, industries with the highest average heatrelated fatalities per year include Agriculture, Forestry, Fishing, and Hunting; Mining; Construction; Administrative and Support and Waste Management and Remediation Services; and Transportation and Warehousing.

8% **NL** white neighborhoods

### Health

Extreme heat days pose significant health risks, particularly for individuals with pre-existing conditions like cardiovascular disease, asthma, diabetes, and obesity. People with these conditions are among the most vulnerable during extreme heat events due to the added strain on their bodies, which can exacerbate their symptoms or lead to emergencies.

### **Disadvantaged Communities**

Disadvantaged communities, identified by the California Environmental Protection Agency, face significant environmental and socioeconomic challenges. Under Senate Bill 535, funds from California's Cap-and-Trade Program prioritize these areas to reduce pollution, build climate resilience, and improve health and economic outcomes.
